

ABSTRACT

A chain link remover includes a base having an opening formed by an anvil and having a screw hole for threading with a threaded shaft which has a link ejector rod to remove the chain link pin from the chain. A support device is disposed in the base to support the chain in the opening of the base, and to retain the chain between the anvil and the threaded shaft, and thus to allow the chain link pin to be easily disengaged or removed from the chain without holding by the users. The support device includes two pawls to engage with and to support the chain between the anvil and the threaded shaft, with such as resiliences.
